

size not reported in bytes; not placeable on the axis above

The energy figures do not share a measurement boundary: a combinational logic network on programmable logic and a board-level figure that includes a host processor are not comparable.

3 of the 7 anchor studies report no model size in bytes and 4 report no energy per inference.

No trend line is drawn: the points come from different protocols, datasets and class definitions, so no relationship between size and accuracy can be estimated from them.
